

## Reflection

This assignment is my first time attempting a project from scratch on my own. It was tough reading the instructions and trying to figure out what exactly I'm supposed to do, and even after reading the Rails tutorial, I was still lost and just confused. Compounded by my tight schedule during the holidays, I considered giving up many times, or just to submit one with basic CRUD structure and tags as plain text. However, after participating in a hackathon during Week 1 of school, I became motivated to do more research on tagging and finally managed to add links to the tags, bringing the user to a page with all tasks associated with selected tag. Subsequently, in my free time, I would add the functions of checking and unchecking tasks, in case the user wants to keep a list of his completed tasks instead of simply deleting them. I would also learn the front end design to make the page look more aesthetic, and add other functionalities.

It has been a valuable experience climbing the steep learning curve, learning to cope with increasingly tight schedules and picking up completely foreign concepts without (much) guidance. While I did discuss some parts with friends, ultimately I was solely responsible for my work. The experience of self-learning so many things has been both frightening and fulfilling, though it also makes me miss working with a team. All in all, unfortunately this is not the best work I can produce, but I will certainly continue to train myself and aim for greater heights.

## User Manual

Tags: each tag brings user to page of all tasks with selected tag. Back button on that page redirects user back to page with all tasks.
